- First in silico Whole Cell Model
- Genome (525 genes), transcriptome, proteome and metabolome incorporated
- Describes whole life cycle of a single cell on molecular level, and
- predicts a wide range of cellular behaviors, and
- accounts for the specific function of every annotated gene product
- Based on 900+ publications
- Consists of 116 MATLAB files
- Incorporates over 1.900 experimentally observed parameters

All data and processing are available online, for download or one-stop exploration.

### *Mycoplasma genitalium*

The *M. genitalium* WC model was the first model that represented each characterized gene function of an organism. The model is composed of 28 submodels of 28 cellular processes. In total, the model represents the functions of 401 genes, 722 compounds, 1,857 reactions, and 1,836 parameters. In addition to demonstrating the feasibility of WC models, the model has been used to gain new insights into cell cycle regulation, learn unknown parameters, and suggest new uses of existing antibiotics for *Mycoplasmas*.

### Coordinating standards for modeling in biology

The 'COMputational Modeling in Biology' NEtwork (COMBINE) is an initiative to coordinate the development of the various community standards and formats for computational models. By doing so, it is expected that the federated projects will develop a set of interoperable and non-overlapping standards covering all aspects of modeling in biology.

#### Recommendations

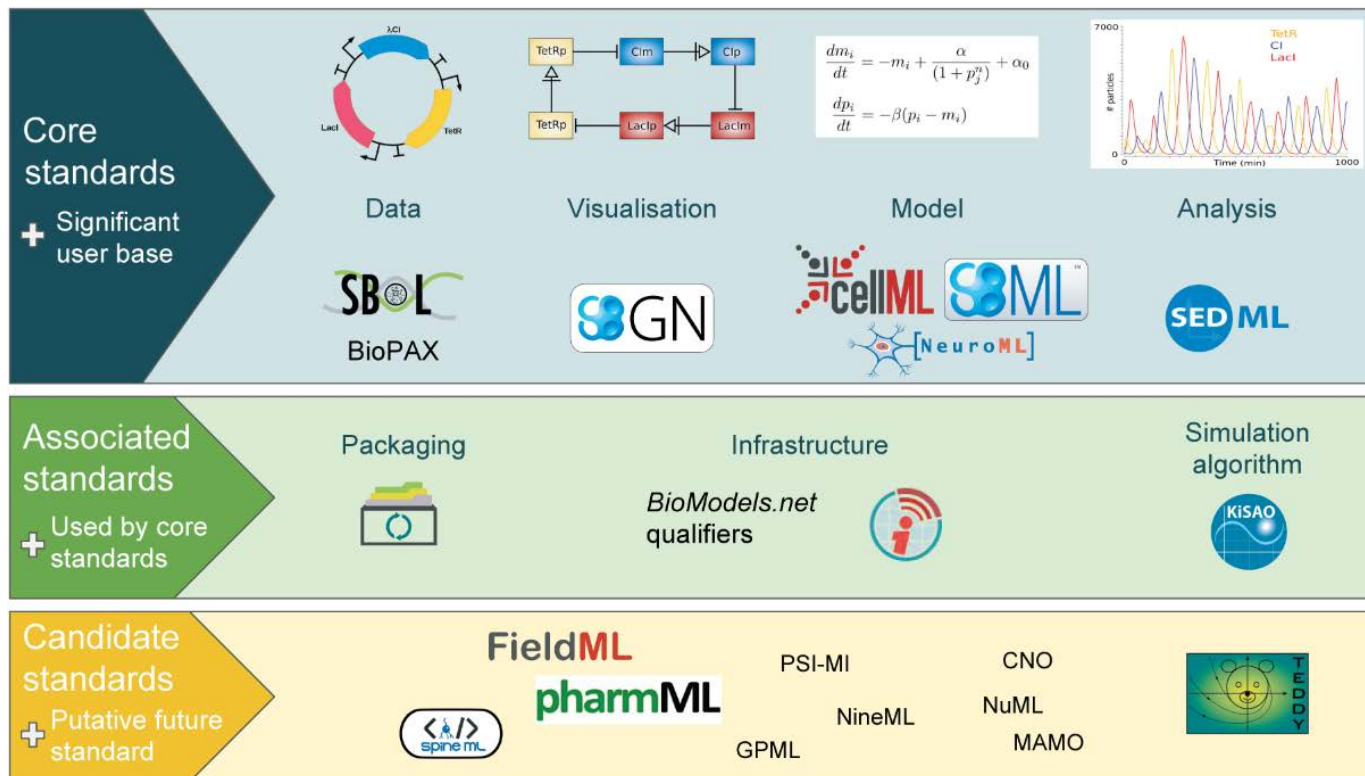

#### Data formats

#### Semantic / Ontologies

Check out our online resources to learn how to make your model code interoperable – and how you can get involved in development.

- Editorial Boards
- Software tool support
- Annual meetings
- Mailing lists
- Specifications

You can use standards-compliant models  
with many open libraries & tools.

Different open model repositories give you access to curated models.

## Reproducible simulation studies targeting COVID-19

In a collaboration between the University of Greifswald, the Humboldt-University Berlin, code ahoi, and the BioModels database at EMBL-EBI, we aim to rapidly disseminate simulation studies of COVID-19 models to the research community, in interoperable formats and in high quality.

### List of curated models

<a href="#">BIOMD0000000955</a>	<a href="#">Giordano2020 - Modelling the COVID-19 epidemic and implementation of population-wide interventions in Italy</a>
<a href="#">BIOMD0000000956</a>	<a href="#">Bertozzi2020 - The challenges of modeling and forecasting the spread of COVID-19</a>
<a href="#">BIOMD0000000957</a>	<a href="#">Roda2020 - Why is it difficult to accurately predict the COVID-19 epidemic?</a>
<a href="#">BIOMD0000000958</a>	<a href="#">Ndairou2020 - Mathematical modeling of COVID-19 transmission dynamics with a case study of Wuhan</a>
<a href="#">BIOMD0000000960</a>	<a href="#">Paiva2020 - A data-driven model to describe and forecast the dynamics of COVID-19 transmission</a>
<a href="#">BIOMD0000000962</a>	<a href="#">Zhao2020 - Modeling the epidemic dynamics and control of COVID-19 outbreak in China</a>

You can follow defined steps to make your models better reusable.

1. Decide for a repository
2. Check accepted formats and upload procedures
3. Prepare your model (use standards, annotate, document, provide an archive containing the files to reproduce all virtual studies described in the paper)
4. Upload your model and (Cross fingers for positive curation results)
5. Receive URI for further reference
